

Bug 1:

Wrong SQL where condition

File: TaskRepository.java, line 14

While I was checking the query, I noticed that the 'OR' condition was not inside brackets.

The problem is that SQL gives 'AND' higher priority than 'OR'. Because of this, the condition was not working in the way it looked.

For example: the query was basically

doing:-

archived = false AND title matches.

OR
description matches AND status matches.

So in the first case the status condition was not applied, and in the second case the archived condition was not applied.

Because of this, archived tasks could also come in the result of the status filter could give wrong results.

fix I added brackets around the
title / description OR condition:

archived = false
AND (title matches OR description matches)
AND (status matches)

I used this fix because only the
grouping of the condition was wrong.
No other part of the query needed
to be changed.
