

Bug - 3 : Race condition in useTasks.js

File: frontend/src/hooks/useTasks.js

I found that the useEffect was making the fetch request but there was no cleanup for the previous request.

This became a problem when the user changes the search quickly.

For example: the user searches for "java", then immediately changes it to "javascript". Both requests are running at the same time.

If the "javascript" request finishes first, its result is shown. But if the older "java" request finishes after that it can replace the new request with old data.

fix! I added an AbortController
inside the useEffect and passed
its signal to fetch().

when the effect runs again,
the cleanup function calls
controller.abort(), so the previous
request is cancelled.

This makes sure that old requests
don't interfere with the new
search.
