

Bug - 1 :- Loading state not cleared on error.

File :- frontend / src / hooks / useTalkp.js
while checking the error handling, I noticed that setLoading (false) was called when the request succeeded, but not when it failed.
So if the API request failed because of a network error, the error was stored correctly, but loading was still true.

Because of that, the UI could keep showing "loading task..." even though the request was already failed.

Fix :- I added setLoading (false) inside the catch block.

I also checked for AbortError separately because an aborted

request is expected when the
user changes the search. It
should not be treated as a
real API error.
