

Bug - 5: page number not reset after filters changes.

file: frontend/src/App.jsx.

Here, query, status and page were being maintained as separate states.

The problem is that when the user changes the query or status, the page number stays the same.

for example: Suppose I am on page 3 and then search for something which has only 5 results. The app will still request page 3.

Since there may be no page 3, it will show "No tasks found", even though there are results page 1.

fix: I created `handleQueryChange()` and `handleStatusChange()` functions.

These functions change the query/status and also set the page back to 1.

Then I passed these functions to the SearchBar and StatusFilter instead of directly passing the state setters.

This makes sense because changing a filter changes the whole result set, so the user should start from page 1 again.
